Docker Init: Initialize Dockerfiles and Compose files with a single CLI command

Marc Sherwood

Nuno Coracao

Docker has revolutionized the way developers build, package, and deploy their applications. Docker containers provide a lightweight, portable, and consistent runtime environment that can run on any infrastructure. And now, the Docker team has developed `docker init`, a new command-line interface (CLI) command introduced as a beta feature that simplifies the process of adding Docker to a project (Figure 1).

Note: Docker Init should not be confused with the internally -used `docker-init` executable, which is invoked by Docker when utilizing the `-init` flag with the `docker run` command.

Docker Init?

- Introduced in Docker Desktop 4.19

- Start new Projects fast

- Use State of the Art Dockerfiles

- Currently locked behind Docker Desktop

- Supported Languages

    - Go

    - Python

    - Node

    - Rust (soon)

    - General Purpose

Call for feedback

Using the CLI • Find the Link in the Blog Post • use the QR-Code

Demo Time!
